INDEX TO ASSESSMENT REPORTS 1981 TO 1985

INTRODUCTION

Report 86-2 is a bibliographic index to the mineral and petroleum exploration assessment reports submitted to the Nova Scotia Department of Mines and Energy that became publicly available from 1981 up to the end of 1985. This index provides information on the assessment reports by title only. The actual data must be obtained from the documents cited in this index.

Report 86-2 is the second volume of Index to Assessment Reports to be published. The first volume published was **Report 81-4 Index to Assessment Reports 1864-1980,** covering all open assessment reports available up to the end of 1980. The second volume, **Report 86-2 Index to Assessment Reports 1981 to 1985,** covers all open assessment reports available from 1981 up to the end of 1985. **Report 86-2** supercedes the previously published annual indexes to assessment reports for 1981 **(Report 82-2),** 1982 **(Report 83-2),** 1983 **(Report 84-2)** and 1984 **(Report 85-2).**

All the assessment reports cited in this index have been microfilmed (except OFFSHORE reports with COGLA #s), and can be consulted in the libraries of the Halifax and Stellarton offices of the Department, where they are filed on the basis of their report numbers. Microfiche copies of these reports can be purchased directly from Precision Microfilming Services, 6100 Young Street, Halifax, Nova Scotia, B3K 2A4 (902 455-5451). If ordering microfiche copies of assessment reports, please quote the full assessment report number e.g. 11D/10C 21-H-91(01). OFFSHORE reports with COGLA #s can be consulted in hard copy in the Energy Resources Division of the Nova Scotia Department of Mines and Energy in Halifax, and microfiche copies of these reports can be purchased through the Canada Oil and Gas Lands Administration (COGLA), 355 River Road, Ottawa, Ontario, K1A 0E4 (613 993-3760).

INDEX ORGANIZATION

Report 86-2 is in fact four separate indexes to assessment reports under one cover, namely, a Claim Reference Map Index, an Offshore Index, a Keyword Index, and a Map Index.

Claim Reference Map Index

The Claim Reference Map Index is a hierarchical, geographic index to the assessment reports that is primarily organized on the basis of the Nova Scotia Department of Mines and Energy claim reference map system (see below). Within each claim reference map section, the assessment reports are further ordered on the basis of assessment report number (see below) with subordering by means of commodity, followed by county, followed by location, followed by successive report number.

Offshore Index

The Offshore Index is a listing of all assessment reports describing mineral and petroleum exploration work that was conducted offshore from mainland Nova Scotia. The offshore has been divided up into a number of distinct geographic regions e.g. Sable Island Bank, and the reports are organized alphabetically by geographic location.

Keyword Index

The microfiche Keyword Index (inside, back cover) is an alphabetic listing of all the keywords, or important names and terms, which have been used to describe each assessment report in the GEOSCAN database (see below). The types of information found in the Keyword Index include: geological, paleontological, geochemical and geophysical subject terms; mineral and commodity names; illustrations; stratigraphic unit, fold and fault names; mine, shaft, deposit, prospect and vein names; coalfield and gold district names; geographic location and county names; and personal author, exploration and mining company, and licensee names.

In the Keyword Index, listed below each keyword are the titles of all the assessment reports in **Report 86-2** which contain that particular name or term in their GEOSCAN records. Thus, the Keyword Index allows all the assessment reports in **Report 86-2** to be searched on one specific name or term. For example, all the assessment reports in **Report 86-2** that are concerned with exploration for gold can be found listed as a series of titles under the keyword "GOLD" in the alphabetic listing of keywords in the Keyword Index.

Map Index

The microfiche Map Index (inside, back cover) is an alphabetic listing of all the specific types of maps found in the assessment reports cited in **Report 86-2.** Table 1 lists the terms used to describe the specific map types found in the assessment reports cited in **Report 86-2.** The Map Index is organized on the basis of the Nova Scotia Department of Mines and Energy claim reference map system, with the map types listed alphabetically within each claim reference map section.

ASSESSMENT REPORT TITLES

The titles of the assessment reports cited in this index are not the original titles of the reports, but are modified titles composed by the authors. The modified titles are designed so that it is possible for the reader to determine from the report title exactly what types of geological, geochemical, geophysical, drilling and other exploration activities are described in each report. Each assessment report title contains information on the following:

Commodity
Location
County
Province
Exploration Company
Licensee (if different from Exploration Company)
Report Contents
Author
Year Written
Number of Pages
Number of Maps
Map Types
Enclosures e.g. drillhole logs, sections.

ASSESSMENT REPORT NUMBERS

Each assessment report is uniquely identified by an assigned report number e.g. 11D/10C 21-H-91(01), which is a code consisting of the following five components: claim reference map; commodity; county; location; and successive report number. For example -

11D/10C = claim reference map
21 = commodity (= gold)
H = county (= Halifax)
91 = location (= Crows Hill Lake)
(01) = successive report number (= the first report in the assessment file 11D/10C 21-H-91)

These five report number components are described below.

Claim Reference Map

The claim reference map system (Fig. 1) is used by the Nova Scotia Department of Mines and Energy for map staking of mineral exploration claims. This claim reference map system is based upon the National Topographic System (NTS), whereby each claim reference map is one-quarter of a 1:50 000 NTS map. For example, NTS map 11D/10 consists of claim reference maps 11D/10A, 11D/10B, 11D/10C and 11D/10D, these maps being lettered in a clockwise direction from the southeastern corner of NTS map 11D/10.

The claim reference map indicates where in the province the exploration activities described in the assessment report were conducted. Only one claim reference map can appear in an assessment report number. Assessment reports which fall entirely within the boundaries of one claim reference map have their titles listed only once under that one particular claim reference map in the Claim Reference Map Index (see below). Assessment reports which fall across the boundaries of two or more claim reference maps have their titles listed under each one of the affected claim reference maps in the Claim Reference Map Index. For example, an exploration program conducted near Windsor (Fig. 1) could fall within the boundaries of claim reference maps 21A/16D, 21H/01A, 11E/04B and 11D/13C. In the Claim Reference Map Index, the title of that assessment report would be listed under each one of these four claim reference maps. Thus, report titles are commonly listed under several different claim reference maps in the Claim Reference Map Index.

Work on mineral (not petroleum) exploration licences can also be conducted offshore from mainland Nova Scotia e.g. for placer gold in marine sediments. These reports are assigned regular assessment report numbers and are found

listed within the normal claim reference map divisions. However, in order for all offshore work to be conveniently grouped together, these reports, along with petroleum exploration assessment reports, are listed in the OFFSHORE Index, after the Claim Reference Map Index. Within the OFFSHORE section reports are organized alphabetically by geographic location.

Commodity

Commodity represents the primary element, mineral or rock that formed the target of the exploration activities described in the assessment report. Each commodity is assigned a numeric code which is identified in Table 2. Assigning one commodity to an assessment report is an arbitrary decision, especially when several commodities could form the exploration target e.g. tin, tungsten and molybdenum. In such cases, although the report is identified by only one commodity in the report number, the other relevant commodities are recorded as keywords in the GEOSCAN database (see below), and the report is still identified under these additional commodities in the accompanying Keyword Index (see below).

County

County represents one of the eighteen formal districts of Nova Scotia in which the exploration activities were conducted. Each county is assigned a letter code which is identified in Table 2. For convenience, unofficial counties such as Cape Breton Island, Offshore and Nova Scotia have also been added to this category. Again, only one county can appear in the assessment report number. If an assessment report crosses county borders, the report is still identified under the additional counties in the Keyword Index.

Location

Location represents a specific town, village, lake, stream, hill, swamp etc. that falls within the area of the exploration activities described in the assessment report. A list of these locations and their correspoding number codes is kept on file in the Department. However, the location is always named in the report title.

Successive Report Number

The successive report number (01 and onwards) represents an individual assessment report assigned to a particular assessment file. In general, reports are numbered from oldest to most recent. The number (00), when used, represents a miscellaneous information category in which is usually found old memos, letters, incomplete reports and individual maps that did not belong to individual assessment reports.

GEOSCAN

Report 86-2 was generated from GEOSCAN, which is a bibliographic database providing access to publicly available geoscience literature concerning the Canadian landmass and offshore regions. The database is co-operatively produced from the indexing contributions of twelve federal, provincial and professional geoscience organizations located throughout Canada. The Geological Survey of Canada co-ordinates these indexing activities and provides computer resources in support of GEOSCAN. The Nova Scotia Department of Mines and Energy is an active participant in GEOSCAN, and specific search enquiries and custom indexes can be generated upon request from GEOSCAN, using on-line terminal connections in the Halifax office, or through the National GEOSCAN Centre, Geological Survey of Canada, in Ottawa.
